FOREWORD

The mission of the Health Care Financing Administration (HCFA) is to promote the timely delivery of appropriate, quality health care to the nation's aged, disabled, and poor. The agency must also ensure that beneficiaries are aware of the services for which they are eligible, that those services are accessible, and that agency policies and actions promote efficiency and quality within the total health care delivery system.

To that end, the annual release of the Medicare Hospital Information report is a key element in our continuing efforts to improve the effectiveness of medical practice and the quality of care provided to Medicare beneficiaries. It is also an important step in helping beneficiaries make more informed health care decisions.

The information in this release is not intended as a direct measure of quality of care. It is best used as a "screening tool"—that is, to identify potential problems for further review and, in consultation with medical staff, to evaluate a hospital's strengths and weaknesses. Thus, we believe that consumers can use this information to ask questions of their physicians, rather than reach judgments about the quality of care in a particular hospital. We also expect this information to be used by hospital administrators, physicians, peer review organizations, State survey and certification agencies, and researchers.

This publication presents information to answer the question "What is the actual mortality rate within a certain period of time for each hospital compared to the rate that would have been predicted, given what we know about the characteristics of the patients admitted?" Our basic approach to analyzing hospital mortality information has remained unchanged for the past five years; however, since the last publication of mortality information in May 1991, we have made some significant changes both in our methodology and in the way we display the results of our analysis. The four principal changes in the 1992 report are:

- A graphic presentation of the predicted and observed mortality rates for most hospitals for "All Causes" for Federal fiscal years 1988-1990 at 30, 90, and 180 days;
- The addition of information on certain variables that we use in computing the predicted mortality rates for each hospital;
- The addition of information on the geographic origin of each hospital's patients; and

- A comparison of the average length of stay in each hospital with the average for the State and Nation.

These refinements should make this information an even more valuable educational tool to help improve the quality of care in hospitals. The changes were reviewed by a panel of outside experts. The methodology used to calculate the observed mortality rate, the predicted mortality rate, and the standard deviation are briefly described in the Technical Information section of the Introduction to this volume and in more detail in the Technical Supplement (Volume 55).

We acknowledge the assistance we have received from the American Hospital Association—not only for providing the information detailing selected hospital characteristics, but also for alerting its members to the importance of this information. We are also grateful to the personnel in each hospital who took the time to review the data thoroughly and to provide us with comments and suggestions. As before, we have published individual hospitals' comments in their respective State volumes. Over the years, these communications have helped to improve and refine the information included in this publication.

HCFA is committed to improving the Medicare Hospital Information report. To that end, we are continuing to work with representatives of hospital, consumer, employer and other organizations to make this annual report as useful as possible for all consumers.

State and National Hospital Information 446

Hospital Comments

INTRODUCTION

The Medicare Hospital Information report contains information on acute care hospitals that treated Medicare patients discharged in Federal fiscal year (FY) 1990 (October 1, 1989—September 30, 1990).

This year's publication set consists of 54 State volumes and a Technical Supplement (Volume 55). There is one volume per State, except that California and Texas have two volumes each, Hawaii is combined with American Samoa and Guam, and Puerto Rico and the Virgin Islands are combined together in one volume.

Each hospital's two summary data pages are arranged alphabetically by hospital name in each State volume. These data pages consist of:

- The hospital's FY 1990 Medicare hospital mortality rates;
- A graphic presentation of the predicted and observed mortality rates for **most** hospitals for "All Causes" for FYs 1988—1990 at 30, 90, and 180 days;
- The FY 1990 values for selected explanatory factors used to predict the mortality rates;
- Origins and lengths of stays of Medicare admissions; and
- Hospital characteristics, such as the number of beds and other characteristics, which we obtained from data contained in the American Hospital Association's (AHA) 1990 Annual Survey of Hospitals files or, when such information was not available from the AHA file, the Health Care Financing Administration's (HCFA) Online Survey, Certification and Reporting System (OSCAR) file.

> ***Please note that the information regarding origins and lengths of stays and hospital characteristics are presented strictly for information purposes only. They were not used to calculate the hospital's predicted mortality rates.***

Toward the end of each volume, we include both State and national mortality rates developed by our analysis, as well as the comments we received from individual hospitals.

DESCRIPTION OF MORTALITY INFORMATION

The mortality rates at a given hospital may reflect, among other factors, the age, sex, diagnoses, and severity of illness of patients admitted to that hospital, as well as the quality of care they received. Factors affecting health and the probability of death vary among the patient populations served by individual hospitals. Consequently, the mortality rates in different patient populations vary considerably.

These latest analyses of the mortality rates associated with Medicare hospitalizations are similar to those carried out in the four prior years. Only one hospitalization for every patient was used. As in last year's analysis, when a patient had multiple hospitalizations during the fiscal year, one stay was selected at random to be analyzed. We believe that the use of the randomly selected admission provides a better representation of a typical hospital admission and permits us to calculate mortality rates more nearly like those the hospital itself would calculate for its patients.

Although we publish data only on deaths which occur within 180 days of admission to the hospital, for purposes of analysis our methodology actually considers deaths which occur any time within 365 days of admission (with the exception that no date of death later than April 1, 1991 is used). This is part of the formula which assesses the long-term risk of mortality. With this approach, information about the early and later results of the hospitalization is provided. This is important because diseases evolve with different time courses, and treatments may have different short- and long-term effects. The choice of at least 180 days allows substantial followup consistent with timely reporting of HCFA data.

We again analyzed the data on a fiscal year, rather than on a calendar year, basis because it allows us to report on recent hospitalizations. Also, new Medicare rules are often instituted on a fiscal year basis.

For each hospital, mortality rates are presented for overall Medicare patient mortality and for eight medical conditions and nine procedures. The information consists of the number of Medicare patients; the observed or actual mortality rate (OBS); the predicted mortality rate (PRED), given the mix of patients; and a standard deviation (SD), a measure of the uncertainty of the predicted rate.

The following information will be helpful when reviewing specific information for any given hospital.

Number Of Cases

This is the number of individual Medicare beneficiaries whose discharge in a fiscal year from the short-term, acute care hospital listed was selected for analysis. The total number of cases randomly selected for each hospital is presented under the category "All Causes." The eight medical condition and nine surgical procedure categories are subgroupings drawn from the "All Causes" selection. Although a particular patient may appear in only one of the eight medical condition categories, that same patient may also appear in one or more of the nine surgical procedure categories. Similarly, a patient may appear in one or more of the nine surgical procedure categories, even though he or she was not included in any of the eight medical condition categories.

The categories chosen for display represent HCFA's interpretation of the categories judged to be important by various outside advisors including the Institute of Medicine. The listed condition and procedure categories do not cover the reason for admission of all the hospitalized Medicare patients in this study. (The ICD-9-CM codes included in each condition and procedure category appear in Table 1 following this Introduction section.)

These conditions and procedures represent the causes for the hospital admission and/or surgical episodes during that stay; they do not necessarily represent the cause of death. HCFA does not have access to cause of death information.

Observed Mortality Rate (OBS)

The observed mortality rate for each category is the percentage of each acute care hospital's selected Medicare patients who died within 30, 90, or 180 days of the selected admission. This rate does **not** represent the percentage whose death was caused by a particular condition or procedure.

The percentage is rounded to the nearest one-tenth of one percent. Both inhospital deaths and deaths occurring after discharge but within 30, 90, or 180 days of admission are included. For example, if a hospital had 1,000 patients included in the "All Causes" category and 124 of these patients died within 30 days of the selected admission, the 30-day observed mortality rate would be 12.4 percent; if an additional 17 patients died more than 30 but less than 91 days after admission, the 90-day observed mortality rate would be 14.1 percent; and if an additional 13 patients died more than 90 but less than 181 days after admission, the 180-day observed mortality rate would be 15.4 percent.

It is important to note that the observed mortality rate is cumulative; e.g., the 90-day observed mortality rate includes all deaths which occur within 30 days of admission, as well as those occurring more than 30 and less than 91 days after admission.

Predicted Mortality Rate (PRED)

The predicted mortality rate for each hospital's patients is derived in part by determining, based on national experience, the contribution to the probability of dying associated with various patient characteristics such as:

- Principal diagnosis (grouped into 23 analytical risk categories),
- Age,
- Sex,
- Previous hospital admissions within the prior six months,
- Admission source (e.g., physician reference, skilled nursing facility reference),
- Admission type (e.g., elective or emergency), and
- The presence of up to seven comorbid conditions—cancer, chronic cardiovascular disease, chronic renal disease, chronic liver disease, chronic pulmonary disease, cerebrovascular degeneration, and chronic diabetes. A list of the ICD-9-CM codes defining the comorbid conditions is in Table 2 following this Introduction section.

Standard Deviation (SD)

The standard deviation is a tool to gauge the extent to which the difference between the observed and predicted mortality rate is meaningful. In general, the greater the difference between the two rates, the greater the probability that the difference represents an actual variation from what would be expected in view of the national experience. The less chance that the difference between the PRED and the OBS can be attributed to statistical variability, the more grounds for possible concern about the institution's performance.

Information on how to use the SD to construct prediction intervals for use in assessing the real difference between the OBS and the PRED is included in the Technical Information section of this Introduction. The precision and interpretability of the estimates are weaker when there are no deaths or 50 or fewer cases in a particular category being analyzed. Thus, for these instances, dashes ("---") are placed in the SD column.

OBSERVED MORTALITY RATE AND PREDICTED RANGE FOR MEDICARE PATIENT ADMISSIONS FOR ALL CAUSES

Also in this year's report, we have presented graphs that display the information for most hospitals described above for FYs 1988 and 1989, as well as FY 1990. (In particular, these graphs could not be computed for hospitals that had 50 or fewer cases or no deaths in FYs 1988, 1989, or 1990). In constructing the graphs, we used 2 times the standard deviation to approximate a 95 percent prediction interval. The observed mortality is shown as a dot (•). The predicted mortality is shown at the middle of a range of mortality rates. The bottom of the range is the predicted mortality minus twice the standard deviation, and the top of the range represents the predicted mortality plus twice the standard deviation. The graphs for FY 1988 and FY 1989 are based on new random samples and new computations for this year's report. Thus, the calculations for some hospitals for FY 1988 and FY 1989 may be different from previous releases, because we are including more current data in this year's report.

FY 1990 VALUES FOR SELECTED EXPLANATORY FACTORS USED TO PREDICT MORTALITY RATES

This year's report includes the FY 1990 average at each hospital of many of the explanatory factors used to predict that hospital's mortality rates. This information provides a profile of the patients used in the analysis and should help to identify possible systematic coding errors in the claims data used to calculate the mortality rates. These percentages are derived from the patients included in the sample and should be applied to the total number of cases listed in "All Causes." It is important to note that neither the admission sources/types nor the comorbidities categories are mutually exclusive. For example, a patient could be both "referred by his personal physician" and "admitted for elective procedure." Similarly, a patient could have secondary diagnoses of both cancer and diabetes.

INFORMATION SOURCES AND NOTES

We believe that when the mortality rate information is properly understood and applied, it can be very useful; it can also be misleading if it is interpreted incorrectly. The information simply describes one of several possible outcomes at a hospital—postadmission mortality for Medicare beneficiaries.

Mortality information is not necessarily representative of a hospital's total performance in all aspects of patient care. Individual hospitals may have very good reasons for their rates being higher than the rates predicted by the HCFA model. For example, one hospital might have different death rates than another because its patient mix is not fully accounted for by the model.

Accordingly, we offered each hospital the opportunity to review their specific information and to provide comments to HCFA and the public, and we included those comments that were received timely at the end of this volume. Users should read the discussions about the uses and limitations of the mortality information found on page xiii, as well as any comments a hospital may have provided.

Hospitals In The Analysis

The hospitals included in this analysis are participating in Medicare as short-term, acute care facilities—all have a zero in the third position of their Medicare provider number. All other hospitals—those with something other than a zero in the third position of their provider number, such as rehabilitation facilities or psychiatric institutions—were excluded. This year, as in the past two years, we have also excluded hospices.

In some cases, we have included data for hospitals that closed, changed ownership, or changed management either during or subsequent to FY 1990. Our data included for those institutions reflects the situation as it existed at the time the hospitalizations analyzed occurred.

Data Sources

This report is based primarily on Medicare hospital billing information for Federal fiscal years 1988, 1989, and 1990. While the principal source of the data for the analysis was the HCFA-maintained Medicare Provider Analysis and Review (MEDPAR) file, which contains information about each Medicare hospitalization, some of the information about beneficiaries, such as date of death, was obtained from the Social Security Administration. Hospitals submit bills to HCFA's fiscal intermediaries (which handle claims for the inpatient care provided to Medicare beneficiaries) which, in turn, submit this information to HCFA. The file is updated on a quarterly basis. Our analysis was based on information available following the June 1991 update of the MEDPAR file. It is estimated that by that time (nine months after the close of the fiscal year), 98 percent of all Medicare discharges in FY 1990 are included in the file.

Possible Limitations Of The Data

In any large-scale data base, such as the one dealing with Medicare hospitalizations, there will be gaps or inaccuracies. For example, last year some hospitals had not accurately reported the source or type of admission, and thus erroneous information was included in the analysis for those hospitals. However, the fact that the files contain information on about 10 million hospital admissions to nearly 6,000 hospitals for each year provides some assurance that, for purposes of the statistical analysis conducted here, the information that might be missing or inaccurate is such a small portion of the total that it would have little effect on the results for national estimates. Nevertheless, it may substantially affect an individual hospital if it were the source of the inaccurate information.

While we feel that the information used in this analysis is thorough and complete, there are a few points to keep in mind as you review the mortality information.

The information used is billing data; it is only as good as the information submitted by hospitals as part of the payment process. Although there is always a possibility that coding errors are included, we assume that, given the link to payment, hospitals have an incentive to submit bills accurately and promptly. We do know, however, that some hospitals submitted incomplete or erroneous data.

For example, following last year's public release of the hospital mortality data, several hospitals wrote to HCFA indicating that they had submitted incorrect data. Furthermore, they stated that if they had given us the correct information, their predicted mortality rates would have been higher than those presented in HCFA's report. Therefore, in this year's report we have annotated those hospitals' data pages with a footnote stating: "This hospital says that it submitted inaccurate data to Medicare and claims that its predicted mortality rate should be higher than that presented above." At this point, however, HCFA cannot confirm the validity of those hospitals' claims. The analysis results might very well be different if the data on which they were based were submitted accurately by those hospitals.

In our previous analysis of mortality data, we discovered that some States had zero admissions from a skilled nursing facility. While some of these problems were corrected on the MEDPAR files used for this analysis, at the time this study was initiated we found empirical evidence that some of the files still contained suspect information. The suspect data were identified by noting those months (date of discharge) and fiscal intermediaries for which the type and source of admission fields appeared to be interchanged. Based on our findings, we reversed these fields to at least partially correct the remaining discrepancies. The following list shows the specific instances for which the fields were reversed for this analysis.

TYPE AND SOURCE OF ADMISSION FLIPPED

FI No.	FI Name	Dates
00030	Arizona Blue Cross	10/01/86 — 12/31/88
00080	Maryland Blue Cross/DC	06/01/87 — 09/30/87
00190	Maryland Blue Cross	06/22/87 — 12/31/88
00400	Texas Blue Cross	12/07/87 — 12/31/88

HOW TO USE THIS INFORMATION

There are several key points to remember about the use of this information. **First, it is important to understand that the difference between the hospitals' mortality rates and the predicted rates in the tables in this report may not be a direct measure of the quality of care rendered in the hospitals.**

Second, the usefulness of this information depends upon the accuracy with which mortality rates can be predicted. We do not currently have any direct measurement tool with which we can fully adjust for severity of patient illness differences among hospitals. For instance, two hospitals may have very different death rates for patients admitted for stroke, even after we have adjusted for age, sex, and several other factors. This might happen because one hospital's stroke patients may consist of a significant number who are admitted in a coma (and are thus more likely to die), whereas another hospital's patient population may represent a broader spectrum of patients with cerebrovascular problems, or because these two hospitals, in fact, do provide different levels of quality of care. In addition, other factors affecting the probability of death in a particular case (e.g., family status/support, overall health status of the patient, etc.) are not included in the predictive model because information on them is not readily available.

Nevertheless, we believe that the information presented in this publication is an important contribution to the health care community and should be helpful to a wide range of individuals and organizations including consumers, hospital administrators, physicians, PROs, and researchers.

Use By Consumers — Some Key Questions

Consumers should read carefully the explanations of the uses and limitations of the information. Listed below are some questions that we recommend a consumer think about before choosing a hospital. Please keep in mind that this is not a comprehensive list, but it should serve to illustrate the types of questions that are important to consider.

- Why are the hospital's observed mortality rates for “All Causes” consistently and significantly above the predicted rates for FY 1990?
- Why are the hospital's observed mortality rates for the condition for which I need treatment or the procedure I will undergo consistently and significantly above the predicted rates for FY 1990?
- How does this hospital's pattern of mortality compare with that of other hospitals in the State and Nation?

- Is the number of cases too small to present a satisfactory picture of the hospital?

- Does the hospital treat a large number of cases in the category for which I need treatment?

- Does the hospital treat a large number of patients who have several co-existing illnesses or who otherwise are likely to be "sicker" than average?

Other Users Of This Publication

Among other users of this publication, we expect that the hospital administrator (in consultation with medical staff) will find the information most useful as a screening tool to evaluate a hospital's strengths and weaknesses. We know that some hospitals and their medical staffs, using established and newly emerging quality assessment techniques, are seeking information that will result in improved health care delivery.

Outside Assistance In Developing This Publication

The development and presentation of the Medicare Hospital Information report continues to be an important part of HCFA's responsibilities in the health care community. To make the information as accurate and useful as possible, over the past several years we have discussed the theoretical framework and statistical approach with a number of nationally recognized technical experts in appropriate fields. Based on their recommendations, we believe that the models used in these analyses continue to be reasonable and appropriate.

In the past, we have conducted validation studies of our methodology. In general, these studies have found correlation between poor quality care and hospitals whose observed mortality rates significantly exceed the rates that would have been predicted. However, we have also found that detailed clinical data which more thoroughly characterize the severity of patient's illness, while they do not materially affect results describing the general pattern of mortality, do, in specific instances, alter our assessment of the comparison of the observed to the predicted mortality rates.

The format for presentation, the process for sharing the information with individual hospitals, and the statistical methodology have been discussed at various meetings with leaders of organizations representing Medicare beneficiaries, physicians, and hospitals. Also, we have spent many months reviewing the comments received from the hospitals regarding their patient-specific data for earlier years and our previous mortality information reports. Many suggestions from these sources have been incorporated into this report.

We have carefully investigated comments from individual hospitals on apparent discrepancies or errors generated in previous years. These discrepancies rarely had an effect on a hospital's overall mortality rate. Most of these instances fell into the following two broad categories.

- **Inaccurate Date of Death** — We found that inpatient billing coding errors (e.g., a hospital bill indicating that the patient's status at time of discharge was “expired” when the patient had, in fact, left the hospital alive) created many of these errors. We now have mechanisms in place that allow a continuous update of HCFA's master file, thereby enabling us to make corrections.

- **Discrepant Case Counts** — Our analysis counts only one acute care discharge in a fiscal year; normally, hospitals count each discharge. Thus, a patient admitted three times in a year would count three times for the hospital, but only once for the purpose of analyzing Medicare hospital mortality data presented in this report.

We believe it is important for consumers of health care to have access to as much information about hospitals as possible when making health care choices. Along with hospital characteristics information, we have added this year information about the origin and length of stay of Medicare admissions. This information is presented for comparative purposes only and was not used in calculating a hospital's predicted mortality rates. These data were not part of the analyses, and any errors or discrepancies in them do not affect the predicted mortality rates.

ORIGIN OF MEDICARE ADMISSIONS

Data on the geographic origin of each hospital's patients are presented in this year's report. We obtained from the Health Insurance Master file the State and county of residence for each Medicare beneficiary discharged from a Medicare-certified, acute care hospital during FY 1990. We then compared that information with the location of the hospital to determine the percentage of all discharges where the patient lived within the same city/county as the hospital location, within the State where the hospital is located, or outside the State. The percentages are derived by dividing the number of discharges of beneficiaries in a geographic category by the total number of Medicare discharges from the hospital. Please note that these are percentages of total Medicare discharges, not of the mortality sample alone.

MEDICARE AVERAGE LENGTH OF STAY

We obtained from the MEDPAR file the total days of care—both Medicare covered and noncovered—and divided that total by the number of discharges from each hospital. Total, rather than covered, days were used because, under the Prospective Payment System (PPS), if a Medicare patient has at least one day of hospital coverage available to him in the current spell of illness, the hospital will be paid the full diagnosis related group (DRG) amount plus any approved outlier amount, regardless of the number of days actually used.

Example: Hospital A had 2,513 Medicare discharges with a total of 24,379 days.

Calculation: $\frac{24,379}{2,513} = 9.7$ days

The Medicare average length of stay is 9.7 days.

HOSPITAL CHARACTERISTICS

As noted previously, we have again included information on selected hospital characteristics such as the number of beds, occupancy rate, ownership, staffing, and specialty services. This information was obtained from the American Hospital Association's (AHA) 1990 Annual Survey of Hospitals, with the exception of the case mix index (CMI), which was derived from HCFA billing data. This file consists of information voluntarily reported by hospitals to the AHA. In instances where AHA data were unavailable, for example for hospitals that did not respond to the AHA survey, we derived the information from HCFA's Online Survey, Certification and Reporting system (OSCAR). The hospital characteristics and the specific special services listed were selected with the concurrence of the AHA as being those most meaningful to the Medicare population. Information on these specific data elements follows.

AHA Definitions (except for CMI)

Survey and Year — AHA 1990. Source is the American Hospital Association's 1990 Annual Survey of Hospital files.

Profile

Total beds (#) — Number of beds (including subacute beds), cribs, and pediatric and neonatal bassinets regularly maintained (set up, staffed, and ready for use) for inpatients as of the close of the reporting period; does not include bassinets for normal newborn infants.

Occupancy rate (percent) — Ratio of average daily census to the average number of beds (statistical beds) maintained during the 12-month reporting period. (NOTE: The number of these "statistical beds" may differ from the bed count at the close of the reporting period.)

Ownership/control — State government, local government, district/authority, church, private nonprofit, private for profit, or Federal Government.

Medicare discharges — The total number of inpatient discharges for Medicare patients for those hospitals selected for the mortality calculations, including all discharges for persons with more than one hospitalization during the year. (The mortality data include only one randomly selected discharge for each hospitalized enrollee. Therefore, this figure may reflect more discharges than the actual number of cases randomly selected for the mortality study.)

Case mix index (CMI) — A measure of the overall complexity of the Medicare cases treated by a given hospital compared to the complexity of the national average case mix. The CMI represents the relative costliness of each hospital's mix of cases compared to the national average mix of cases. A CMI of greater than one means that a hospital treats more complex cases than average. A CMI of less than one means that a hospital treats less complex cases than average. The CMI for each hospital is calculated on an annual basis. In this report, the CMI presented for each hospital is calculated based on its discharges in FY 1990.

A hospital's CMI is calculated by multiplying the number of cases in each DRG by the relative weight of that DRG, summing the products, and dividing the sum by the total number of cases for the year. For calculating the FY 1990 CMI, use the DRG relative weights published in the *Federal Register*, Volume 54, Number 169, pages 36468 ff., dated September 1, 1989.

Staffing (all AHA counts are as of 9/30/90)

Total number of physicians — Total active and associate medical staff.

Percent of physicians who are board-certified specialists — Physicians who have passed an examination given by a medical specialty board and have been certified by that board as a specialist.

Medical residents/interns — Full-time equivalent (FTE) medical residents or interns.

Registered nurses — Full-time equivalent (FTE) registered nurses.

Licensed practical nurses — Full-time equivalent (FTE) licensed practical nurses.

Specialty Services

Burn Unit — Provides more intensive care to severely burned patients than the usual acute nursing care provided in medical and surgical units. Beds must be set up and staffed in a unit specifically designated for this service.

Cardiac Intensive Care — Provides patient care of a more specialized nature than the usual medical and surgical care, on the basis of physicians' orders and approved nursing care plans. The unit is staffed with specially trained nursing personnel, and contains monitoring and specialized support or treatment equipment for patients who, because of heart seizure, open-heart surgery, or other life-threatening conditions, require intensified, comprehensive observation and care. May include myocardial infarction, pulmonary care, and heart transplant units. Beds must be set up and staffed in a unit(s) specifically designated for this service.

Comprehensive Geriatric — Provides diagnostic and evaluation services that determine elderly patients' long-term care needs. It includes the assessment of medical conditions, functional activities, and mental and emotional conditions, and incorporates these into a treatment plan which includes family and financial concerns as well as medical needs.

Hospice Care — A program providing primarily medical relief of pain and support services to terminally ill patients and assistance to their families in adjusting to the patients' illness and death.

Medical/Surgical Intensive Care — Provides nursing care to adult and/or pediatric patients of a more intensive nature than the usual medical, surgical, pediatric, and/or psychiatric care on the basis of physicians' orders and approved nursing care plans. Included are medical-surgical, pediatric, and psychiatric (isolation) units. These units are staffed with specially trained nursing personnel, and contain monitoring and specialized support equipment for patients who, because of shock, trauma, or life-threatening conditions, require intensified, comprehensive observation and care. These units may also include cardiac care when such services are not approved in a distinct cardiac care unit. This category is called "intensive care unit" in OSCAR.

Organ/Tissue Transplant — The hospital has the necessary staff and equipment to perform the surgical removal of a viable human organ or tissue from a donor, either living or deceased, and the surgical grafting of the organ/tissue to a suitably evaluated and prepared patient.

Other Intensive Care — Provides nursing care to adult and/or pediatric patients with a specialized disease or condition of a more intensive nature than the usual medical, surgical, pediatric, and/or psychiatric care on the basis of physicians' orders and approved nursing care plans. Examples reported include oncology or spinal cord injuries. These units are staffed with specially trained nursing personnel and contain monitoring and specialized support equipment appropriate for the patients' specialized conditions.

Trauma Center — Provides emergency and specialized intensive care to critically injured patients.

Other Specialty/Hospital-Based Services

Alcohol/Drug — Hospital services for the medical care and/or rehabilitative treatment of outpatients whose primary diagnosis is alcoholism or other chemical dependency.

Rehabilitation — A unit having designated beds and providing a comprehensive array of multidisciplinary medical rehabilitation services.

Psychiatric — Care provided to emotionally disturbed, chronically mentally ill, mentally disordered, or other mentally incompetent patients on the basis of physicians' orders and approved nursing care plans. Beds must be set up and staffed in units specifically designated for this service.

Medicare Swing Beds — The hospital is certified by Medicare to provide "swing bed" services; that is, some acute care beds can be used for skilled nursing facility type care in the hospital for Medicare purposes.

OSCAR Definitions (except for CMI)

Survey and Year — HCFA, most recent year. Data were derived from the Online Survey, Certification and Reporting System (OSCAR).

Profile

Total beds (#) — Total number of operational beds eligible for Medicare payment.

Ownership/control — Church; private, nonprofit; other nonprofit; proprietary; Federal Government; State government; local government; and hospital district or authority.

Case mix index (CMI) — See definition shown in AHA "Profile" section.

Staffing

Medical residents/interns — Full-time equivalent (FTE) medical residents or interns.

Registered nurses — Full-time equivalent (FTE) registered nurses.

Licensed practical nurses — Full-time equivalent (FTE) licensed practical nurses.

Specialty Services

NOTE: There are no specific definitions of specialty services in OSCAR. Characteristics are self-reported by each hospital at initial Medicare certification and recertification, and are generally understood to parallel the explicit AHA definitions (above). The AHA categories "comprehensive geriatric" and "other intensive care" are not available in OSCAR. However, they may be included in the OSCAR category of other specialty services (not shown in table).

Coronary Care — See definition shown in AHA "Specialty Services" section.

Intensive Care Unit — See definition shown in AHA "Specialty Services" section. These units may also include other intensive care units in OSCAR reporting.

Organ Transplant — See definition shown in AHA "Organ/Tissue Transplant" section. May include tissue transplants because there is not a separate field in OSCAR for these services.

TECHNICAL INFORMATION

DATA SOURCES

The data analyzed in this report are obtained from the Medicare Provider Analysis and Review (MEDPAR) file for the fiscal years 1987-1990, which contains information on the hospital stays of Medicare beneficiaries. The principal sources of data for this file are the bills (known as HCFA-1450 or UB-82) submitted by the hospitals to HCFA through fiscal intermediaries. The MEDPAR file also contains data about the beneficiaries, such as age, sex, and date of death, which are obtained from the Social Security Administration, the Railroad Retirement Board, or the Office of Personnel Management.

Hospital stays with discharges in fiscal years 1988, 1989, and 1990 were used in these analyses. Hospital stays in 1987 were used only to characterize the prior admissions of the patients in the 1987 cohort. Only acute care hospital stays in short-term (general and specialty) hospitals were selected. These hospitals have a "0" in the third position of their Medicare provider number. Hospital stays in institutions (designated by a "9" in the fourth position of the provider number) and hospital stays in psychiatric units, rehabilitation units, swing-beds and alcohol/drug units (with "special unit codes" of S, T, U and V, respectively, in the third position) were excluded.

THE MORTALITY MODEL

For each beneficiary in each year one hospitalization was selected at random. Choosing a specific hospitalization is necessary to avoid multiple counting of the same death for that year. Selecting a random hospitalization instead of the first or last in the year produces mortality rates that are more representative of the rates that a hospital might calculate for its patients. Also, the mortality rates based on this random selection process reflect an intermediate position between the rates produced by the alternatives.

The selected hospital stays were analyzed separately by analytical category. The analytical categories were created by grouping ICD-9-CM diagnosis codes that had similar mortality patterns. The procedures for creating the analytical categories and the groups of ICD-9-CM diagnosis codes that defined them are detailed in the Technical Supplement.

The mortality experience of the patients was evaluated as a function of time within 365 days of the admission. The factors included in the mortality model used to evaluate each patient's probabilities of death are given in Table 3. They consist of demographic characteristics (age and sex), major comorbidities (chronic diseases likely to have been present at admission and believed to complicate management and increase the likelihood of an adverse outcome), prior admissions (grouped into five risk or severity levels) within the 6 months preceding the admission evaluated, admission type (emergent, elective, etc.), and admission source (referral from the physician's office, the nursing facility, etc.). The specific reason for the admission (the principal diagnosis) and the performance of selected surgical procedures were additional factors used in the estimation of the predicted probability of death (see below).

The observed mortality rate for a hospital was calculated by means of the lifetable method ("The LIFETEST Procedure," Chapter 22, SAS User's Guide: Statistics, Version 5 Edition, pages 529-557).

ANALYTIC TECHNIQUES

A time-to-event or survival model with explanatory or concomitant variables was used to ascertain the influence of the patient characteristics listed above on the probability of death. A feature of such a model is allowance for "right censored" observations. Generally, these are events or outcomes which would have occurred but for some interference that prevents further observation. In the present analysis, "right censoring" occurs when a patient is withdrawn alive from the study April 1, 1991 or at the end of the followup period of 365 days.

The survival function, S(t), is one of several equivalent ways of expressing the model. Another form uses the cumulative distribution function or the mortality function

$$F(t) = 1 - S(t).$$

Another useful formulation of these models is the hazard function, h(t), also known as the force of mortality or risk function. The hazard is the rate of decrease in the number of survivors relative to the number of survivors at a specific time. Mathematically, the hazard function is

$$h(t) = -\frac{1}{S(t)}\frac{dS(t)}{dt} = -\frac{d\ln(S(t))}{dt}.$$

The probability density function, f(t), commonly used in statistical texts can be expressed as follows:

$$f(t) = \frac{dF(t)}{dt} = h(t)S(t).$$

The area under the survival curve is the expected value for t. In some cases, the area under the survival curve is restricted to an interval $0\text{-}t_1$ where t_1 might be one year, for example.

The specific time-to-event or survival model used in the present analysis is Bailey's modification of the Makeham model. The survival function for the Bailey-Makeham model is

$$S(t) = \exp\left\{-\delta t - \left(\frac{\alpha}{\gamma}\right)(1 - \exp(-\gamma t))\right\}$$

where

$$\alpha = \exp(\alpha_0 + \alpha_1 x_1 + \ldots + \alpha_i x_i + \ldots + \alpha_k x_k)$$
$$\gamma = \exp(\gamma_0 + \gamma_1 x_1 + \ldots + \gamma_i x_i + \ldots + \gamma_k x_k)$$
$$\delta = \exp(\delta_0 + \delta_1 x_1 + \ldots + \delta_i x_i + \ldots + \delta_k x_k)$$

are the expressions for each of the structural parameters α, γ, and δ in terms of the k concomitant variables x_i and their associated component parameters α_i, γ_i, and δ_i for i=1, 2,..., k and three intercepts or component parameters α_0, γ_0, and δ_0. The structural parameter δ is the long-term risk which is approached as $t \rightarrow \infty$. The structural parameter α is the initial excess risk which decays with rate constant γ.

For the survival function given above, the risk or hazard function has an especially tractable form of an exponential decay which approaches a long-term risk, δ. The hazard function corresponding to the survival function above is

$$h(t) = \alpha \exp(-\gamma t) + \delta .$$

The estimation of the component parameters was carried out in a series of steps in which those covariates which had estimable and statistically significant ($p<0.05$) influences of the probability of death were identified for inclusion in the model. As the model for each of the 23 risk categories was estimated separately, different lists of covariates were used for the final core models.

This first step was followed by the estimation of the additional contribution of specific principal diagnoses in each risk category. In these analyses, the effects of the patient characteristics included in the core models were corrected for. Only those principal diagnoses were retained which were estimable and had more than 900 cases (more than 300 for codes identified by year). Similarly, after adjustment for the effects of both the variables in the core model and the principal diagnoses, correction terms were calculated to estimate the additional information about the probability of death associated with the categorization of the patients into the clinical groups used for the presentation of the data in the mortality tables (see below). These correction terms were negligible for the medical categories but substantial for the surgical categories.

Once the component parameters or regression coefficients α_i, γ_i, and δ_i have been estimated, the predicted probability of patient death at any specified time after admission, 1-S(t), may be calculated for all individuals. To obtain the predicted mortality rate up to a given time for a hospital, it is then only necessary to average over the predicted probabilities of death of its patients to that time.

The analytical categories are useful for grouping the patients into relatively risk-homogeneous strata for the regressions. However, to gain insights into patterns of practice at hospitals, the data are presented for patients grouped into clinically meaningful medical and surgical categories. The 17 clinical categories used in the mortality tables and defined in Table 1 were identified by the Institute of Medicine as being of particular medical and epidemiologic interest.

ESTIMATION OF THE STANDARD DEVIATION FOR PREDICTED MORTALITY

The standard deviation of the predicted mortality rate is used to assess how statistically different the observed mortality rate is from the rate predicted by the national experience with like patients. The standard deviation depends, in fact, on the variance of the residual or the difference between the observed, P, and predicted, $\hat{\Theta}$, mortality rates.

The residual has four components V_1, V_2, V_3, and V_4 where V_1 is the variance of the estimate of the predicted probability of death. This computationally intensive term was negligible for nearly all cases, compared to other components of variance. Consequently, this term was not included in the present analysis.

V_2 is the binomial variance for n patients

$$V_2 = \frac{\hat{\Theta}\left(1 - \hat{\Theta}\right)}{n}.$$

V_3 is the variation among hospitals not explained by the mortality regression models containing the patient characteristics described above.

$$V_3 = \widehat{\mathrm{Var}\left(\Theta\right)} = \left(1 - \frac{1}{n}\right) \widehat{M_2\left(\Theta\right)}$$

where

$$\widehat{M_2(\Theta)} = \left\{\left(\begin{array}{c}\text{Predicted mortality}\\ \text{on basis of}\\ \text{patient characteristics and}\\ \text{adjustment for hospital effects}\end{array}\right) - \left(\begin{array}{c}\text{Predicted mortality}\\ \text{on basis of}\\ \text{patient characteristics,}\\ \text{but omitting the hospital specific effects}\end{array}\right)\right\}^2 \left(\frac{1}{z_p^2}\right)$$

The quantity z_p corresponds to the statistical significance (p-value) of the hospital-specific effect.

V_4 is the variation not explained by the mortality regression models which each include, in addition, an indicator variable for the hospital:

$$V_4 = \left\{\left(\text{Observed mortality}\right) - \left(\begin{array}{c}\text{Predicted mortality}\\ \text{on basis of}\\ \text{patient characteristics, and}\\ \text{adjustment for the hospital specific effects}\end{array}\right)\right\}^2 .$$

(The regression coefficients of the indicator variable for the hospital are a measure of the influence on the probability of patient death of factors not otherwise specified in the model. These factors include severity of illness not adequately reported on by the patient characteristics deduced from the claims data and the hospital's pattern of practice; i.e., performance.)

The standard deviation given in the mortality tables is just

$$SD = \sqrt{V_2 + V_3 + V_4}.$$

STANDARDIZED MORTALITY RATIO (SMR)

Another method of evaluating a hospital's performance—the Standardized Mortality Ratio (SMR)—is obtained by dividing the observed mortality rate by the predicted mortality rate. An SMR of one means the observed and predicted mortality are equal. A ratio greater than one means the observed mortality exceeds the predicted. A ratio less than one means the observed mortality is less than expected. The more extreme the ratio (significantly greater than one indicating unusually high mortality and significantly less than one indicating unusually low mortality), the greater the attention which should be paid to the results of this mortality report.

For each of the conditions and procedures, selected percentiles for the observed distribution of the SMR are displayed in Table 4. The selected percentiles provide benchmarks for comparison. For example, for a hospital with 300 cases in the "All Causes" category, with observed mortality of 12.2 percent and predicted probability of 10.0 percent at 30 days, the standardized mortality ratio is

SMR = 12.2/10.0 = 1.22.

Note that an SMR of one means the observed and predicted mortality are equal, while a ratio greater than one means the observed mortality exceeds the predicted, and a ratio less than one means the observed mortality is less than expected. There will be greater interest in the more extreme ratios, either greater than one — excessively high mortality — or less than one — extremely low mortality.

From Table 4 for FY 1990, we find that the ratio is just below the 75th percentile of 1.23. Hence, slightly under 75 percent of the hospitals have an SMR less than that found at this hospital.

However, for a hospital with 900 cases in the "All Causes" category, with observed mortality of 19.3 percent and predicted probability of 10.0 percent at 30 days, the standardized mortality ratio is

SMR = 19.3/10.0 = 1.93.

Since the SMR of 1.93 is greater than the 97.5 percentile of 1.35 (Table 4 for 750 or more cases), there is cause for concern. To further assess this, we examine the displayed data in terms of the measure of uncertainty, the standard deviation.

MEASURES OF UNCERTAINTY

In principle, to use the standard normal approximations to determine prediction intervals, an adjustment must be applied for the skewness and kurtosis inherent in a mortality rate when the rate is considerably less than 50 percent and the number of cases is small. Table 5 presents the multiplicative factors, based on the binomial distribution, for the standard deviation needed to construct prediction intervals for the mortality rates at confidence levels of 75, 95 and 99 percent. Because of the approximations involved in the estimation of the skewness and kurtosis corrections, their precision decreases as the number of cases and the mortality rate decrease; i.e., as the value of the correction increases. In addition, because of simplifications and approximations in the estimation of the standard deviation, the precision of the multiplicative factors given in Table 5 exceeds the precision of the estimate of the standard deviation. Hence, the following rule-of-thumb represents an adequate approximation to the factors in Table 5 and an adequate guide to the **statistical meaningfulness** of the difference between the observed and the predicted mortality rates.

To illustrate the use of Table 5, consider a hospital with 75 cases and a predicted mortality of 13.0 percent with a standard deviation of 5.0 percent. Overall, for hospitals with patients with characteristics similar to those of this hospital, we would expect the actual or observed mortality rate to lie, 95 percent of the time, either between 13.0 percent and 22.9 percent if the actual is larger than the predicted, or between 3.3 percent and 13.0 percent if the actual is less than the predicted. That is because 22.9 percent = 13.0 percent + 1.98 x 5.0 percent, the factor 1.98 having been read from the section of Table 5 with the heading "95 Percent Prediction Interval" and "Factor for Upper Bound," the row "75" for the number of cases, and, by interpolation, between the "10 percent" and the "20 percent" predicted mortality rate columns. Similarly, 3.3 percent = 13.0 percent - 1.94 x 5.0 percent, the factor -1.94 having been read from the section of Table 5 with the heading "95 Percent Prediction Interval" and "Factor for Lower Bound" and the corresponding row and columns.

Therefore, in comparing the actual and predicted rates, more attention should be given to the hospital whose observed mortality rate lies beyond the bounds calculated for the 99 percent prediction interval than to the hospital whose observed mortality rate lies only beyond the bounds calculated for the 95 percent prediction interval. Likewise, more attention should be given to that hospital than to the hospital whose observed mortality rate lies only beyond the bounds calculated for the 75 percent prediction interval.

For the graphs, the observed mortality and an approximate 95 percent prediction interval are displayed. The prediction interval has bounds at the predicted mortality plus 2 times the standard deviation and at the predicted minus 2 times the standard deviation.

In the mortality rate tables, the observed and predicted mortality rates and the standard deviation as a measure for statistical importance of the difference are displayed for the overall and each of the conditions and procedures.

HOW TO OBTAIN MEDICARE HOSPITAL INFORMATION

The publication has been widely distributed to State health organizations and hospital and medical associations. The publication is available to the public for purchase in 55 volumes, with each volume being sold separately through the Government Printing Office (GPO). More detailed information about the purchase of this publication may be obtained by contacting:

Superintendent of Documents
Government Printing Office
Washington, D.C. 20402

Telephone: (202) 783-3238

As in prior years, the information appearing in the Medicare Hospital Information report is available in machine-readable/electronic format (tape and diskette). The Medicare Hospital Information public use file provides the published information as contained in the 55-volume hardcopy publication, except that the AHA's hospital characteristics are not on this file. Hospital characteristics from HCFA files (OSCAR) are provided instead. The files contain additional information which is useful for supplemental analyses: averages by hospital, MSA, and State for each of the variables used in the model, mortality rates for 15, 30, 60, 90 and 180 days, and cross-reference files which relate State, MSA, and ICD-9-CM codes used to a name. These data should allow analysts to assess an individual hospital's performance in comparison to all hospitals in the State or applicable MSA.

Also available to **hospitals** in machine-readable format is their patient-specific data that were used in the report. These data include the patient variables used in the analysis (e.g., the number and severity level of prior hospitalizations considered by the methodology, admission source and type, etc.) and the predicted probability of death at each time interval for each individual included in the study. With these data it is possible for hospitals to better understand their statistics. **Due to confidentiality considerations, requests for patient-specific data must be forwarded on hospital letterhead, must include the institution's Medicare provider number, and must be signed by the hospital administrator.**

For information about obtaining Medicare Hospital Information electronic media data, please contact HCFA's Bureau of Data Management and Strategy at:

Health Care Financing Administration
Bureau of Data Management and Strategy
Office of Statistics and Data Management
3-A-10 Security Office Park Building
6325 Security Boulevard
Baltimore, Maryland 21207

Telephone: (410) 597-5151

Table 1

DIAGNOSTIC AND PROCEDURE CATEGORIES

The following lists the ICD-9-CM diagnostic and procedure codes used to classify and group patients for presentation

CONDITION/PROCEDURE	**ICD-9-CM CODES** *(D)=Diagnosis code* *(P)=Procedure code*
Heart Disorders/Procedures	
Acute Myocardial Infarction (AMI)	All of 410 (D) (on 10/1/89 exclude 410 with 5th digit of a 2)

Note: *For code 410 a 5th digit was added on October 1, 1989.*

Congestive Heart Failure (CHF)	398.91, 402.01, 402.11, 402.91, 428.0, 428.1, 428.9 (all D)
Angioplasty (ANGPLSTY)	All of 36.0 (P) excluding 36.00, 36.03, 36.04, 36.09 (all P)

Note: *Code 36.0 had a 4th digit added on October 1, 1986. Code 36.0 got digits of 0, 1, 2, 3, and 9, and code 36.04 got some previously coded cases of 39.97. On October 1, 1987, code 36.01 was divided into 36.01 and 36.05, and some cases from 36.02 were put into 36.05.*

Coronary Artery Bypass Graft (CABG)	All of 36.1(P) and not Angioplasty (see above)
Pacemaker Insertion, Initial (PACE)	37.73, 37.74, 37.75, 37.77 (after 10/1/87 use 37.70 through 37.73) (all P)

Note: *Code 37.70 was restructured on October 1, 1987. Previously the code contained both leads and devices. On October 1 these were separated and devices were coded as 37.80 through 37.83, and codes for the leads were changed into various 37.70 codes.*

CONDITION/PROCEDURE	ICD-9-CM CODES *(D)=Diagnosis code* *(P)=Procedure code*
Pulmonary Disorders	
Pneumonia/Influenza (PNU)	All of 480, all of 481, 482.2, 482.3, 482.9, 483, 485, 486, 487.0 (all D)
Chronic Obstructive Pulmonary (COPD)	All of 491, all of 492, all of 494, Disease all of 496; and 466.0, 518.82, 518.5, and 786.09 when there is a secondary diagnosis of any 496 (all D)

Note: *Code 518.8 got a 5th digit on October l, 1987. Some cases from 799.1 were put into codes 518.81 and 518.82.*

Cerebrovascular Disorders/Procedures

Transient Cerebral Ischemia (TCI)	433.1, 433.3, 435 (D) and exclude those patients with an endarterectomy at the time of admission—38.12(P)
Stroke (STK)	431, 434 through 434.9, 436 (all D)
Carotid Endarterectomy (ENDART)	38.12 (P) with 433.1 (D); 433.3 (D) or 435(D) as a principal diagnosis

Musculoskeletal Disorders/Procedures

Fracture of Neck of Femur (FXHIP)	All of 820 (D)
Hip Replacement/Revision (HIPREP)	81.5, 81.6 (exclude 81.69) (all P). On 10/1/89 code 81.51 (P) through 81.53 (P) with same diagnoses.
Open Reduction of Fractured Femur (OPRDUX)	79.35(P) on condition of 820 (D) as principal diagnosis

CONDITION/PROCEDURE	ICD-9-CM CODES *(D)=Diagnosis code* *(P)=Procedure code*
Genitourinary Disorders/Procedures	
Prostatectomy (PROS)	60.2, 60.3 through 60.69 (all P)
Hysterectomy (HYS)	68.3 through 68.7 (P)
Gastrointestinal Disorders/Procedures	
Cholecystectomy (CHOLOTMY)	51.22 (P)
Sepsis	
Sepsis	003.1, 020.2, 022.3, 036.2, 036.3, 036.89, 036.9, 038.0, 038.1, 038.2, 038.3, 038.40, 038.41, 038.42, 038.43, 038.44, 038.49, 038.8, 038.9, 054.5

Table 2

COMORBIDITY CONDITIONS

(all are D codes)

COMORBIDITY	ICD-9-CM CODES
Cancer	141-160.9, 162-172.9, 174-208.91
Chronic cardiovascular disease	412-414.9, 426-429.1
Chronic liver disease	571-572.8
Chronic renal disease	582-583.9, 585-587, 403.01, 403.11, 403.91, 404.02, 404.03, 404.12, 404.13, 404.92, 404.93
Chronic diabetes	250.01, 250.1-250.91
Chronic pulmonary disease	491-493.91, 496
Cerebrovascular degeneration	290-290.9, 294-299.9

Table 3

EXPLANATORY VARIABLES FOR THE MORTALITY MODEL

Generally the same variables are used for all diagnostic categories.

Demographics

SXFM An indicator variable: = 1 if Female, 0 otherwise

AGEFM = AGESP if SXFM = 1, 0 otherwise
AGEML = AGESP if SXFM = 0, 0 otherwise

where

$$\text{AGESP} = \operatorname{sign}(W-65)\left(\left|\frac{W-65}{65}\right|\right)^{1.44}$$

and

$$W = \left\{ \begin{array}{c} 23 \text{ if AGE} \le 23 \\ \text{AGE if } 23 < \text{AGE} < 100 \\ 100 \text{ if } 100 \le \text{AGE} \end{array} \right\}$$

Comorbidities **ICD-9-CM Codes**

(Indicator variables = 1 if comorbidity present on current or prior admission with discharge within 6 months prior to current admission, 0 otherwise)

CCA	Cancer	141-160.9, 162-172.9, 174-208.91
CCV	Chronic cardiovascular disease	412-414.9, 426-429.1
CLV	Chronic liver disease	571-572.8
CRN	Chronic renal disease	582-583.9, 585-587, 403.01, 403.11, 403.91, 404.02, 404.03, 404.12, 404.13, 404.92, 404.93
CDI	Chronic diabetes	250.01, 250.1-250.91
COP	Chronic pulmonary disease	491-493.91, 496
CCE	Cerebrovascular degeneration	290-290.9, 294-299.9

Co Occurrence of Comorbidities

COP_CCV	1 if COP = 1 and CCV = 1, 0 otherwise
CCA_CCV	1 if CCA = 1 and CCV = 1, 0 otherwise
COP_CCA	1 if COP = 1 and CCA = 1, 0 otherwise
CCE_CCV	1 if CCE = 1 and CCV = 1, 0 otherwise
CRN_CCV	1 if CRN = 1 and CCV = 1, 0 otherwise

Admission Sources and Types

(Indicator variables = 1 if source or type present, 0 otherwise)

PREF	Patient referred by personal or HMO physician
TRSNF	Patient transferred from skilled nursing facility
ELCT	Patient admitted for elective procedure
EMRG	Patient admitted for emergency

Co-Occurrence of Admission Source and Type

PREF_ELEC = 1 if PREF = 1 and ELCT = 1, 0 otherwise

Previous Hospitalizations

P_RISK1	Number at 1st risk level with 3 or more set to 3
P_RISK2	Number at 2nd risk level with 3 or more set to 3
P_RISK3	Number at 3rd risk level with 3 or more set to 3
P_RISK4	Number at 4th risk level with 4 or more set to 4
P_RISK5	Number at 5th risk level with 3 or more set to 3
F(T)	Probability of death from previous admission if discharge within 182 days of current admission, 0 otherwise

Time Trend

FLAG89	1 if discharge in FY1989, 0 otherwise
FLAG90	1 if discharge in FY1990, 0 otherwise
INYEAR	Difference between current admission date and April 1 of fiscal year of discharge

Hospital Comments

ALACHUA
GENERAL HOSPITAL
AN AFFILIATE OF SANTAFE HEALTHCARE

March 18, 1992

HealthCare Financing Administration
Medicare Hospital Information
Bureau of Data Management and Strategy
Attention: Robert Moore
Room #3-A-12, Security Office Park Building
6325 Security Boulevard
Baltimore, Maryland 21207-5187

Dear Mr. Moore:

Alachua General Hospital (ID 100082) has received and reviewed the fiscal year 1990 Medicare Hospital Mortality Information as published by the HealthCare Financing Administration (HCFA), and as a result of this review, found errors in the data presented. The data sample was incomplete, and we believe as a result may have distorted the hospital's actual mortality statistics as compared to the predicted value.

The hospital recognizes that the continuation of our standard of quality will be based on our systematic approach to the assessment of quality within the hospital rather than a study of one variable, mortality, which may change drastically from year to year.

Alachua General Hospital is a 423 bed, community not-for-profit hospital serving the Gainesville and surrounding North Central Florida areas since 1928. The major services include general acute care, emergency care, cardiac treatment including heart catheterization and open heart surgery program, cancer treatment including the Hospice program that serves a sixteen-county area in North Central Florida, obstetrics, medical and surgical intensive care units, and an emergency helicopter service.

Many of the services offered by Alachua General Hospital attract patients who are critically ill or are referred for advanced medical treatment that is available through the hospital's medical staff.

Alachua General Hospital is also the largest hospital in a seven-hospital regional system. All but Alachua General Hospital and the Rehabilitation Hospitals are located in rural communities and as a result, Alachua General Hospital receives a significant number of patients from these communities who need the secondary

801 S.W. Second Avenue • Gainesville, Florida 32601-6298 • (904) 372-4321

and tertiary care level available at Alachua General Hospital. In addition, our emergency helicopter service provides transportation to not only severely-injured trauma victims, but also the severely ill heart patients who can benefit from the hospital's cardiac treatment and open heart surgery programs. The hospice program which cares for the terminally ill patient may attract more severely ill patients than a hospital without such a program.

To assure our patients of our continuing commitment to quality of service, the hospital has in place a comprehensive quality assessment and improvement program and is accredited by the Joint Commission on Accreditation of HealthCare Organizations. Our quality assessment program monitors patients treated at the hospital and includes a review of deaths occurring within the hospital. The fact that a death may occur within thirty days, ninety days, and 180 days following discharge from the hospital is beyond the control of the hospital, even though the information is included in the HCFA data. The medical staff screens hundreds of patient medical records for quality on a regular basis as a means to evaluate the care that is provided. This systematic approach to the assessment of quality care results in a consistent level of quality within the hospital.

The use of mortality data as a single assessment of quality of care as used by HCFA is considered by the hospital to be inappropriate and too narrowly focused to be meaningful in the hospital's overall evaluation of the quality of services it provides. In addition, mortality rates may fluctuate considerably from one year to another for any particular hospital and may not, in fact, be related to the quality of care provided.

Thank you for the opportunity to comment on the recently-published Medicare Hospital Mortality Information.

Sincerely,

William A. Puckett
Chief Operating Officer

ATTN: Robert Moore

Dear Dr. Wilensky and Mr. Moore:

In response to the recent mortality information relating to North Ridge Medical Center, I would like to offer the following information that would be of interest relating to these statistics.

North Ridge Medical Center is a major referral center for cardiology and receives numerous transfers from other hospitals in South Florida. Because North Ridge Medical Center specializes in the treatment of heart disease with special emphasis on cardiac surgery, the case mix index is one of the highest in the State of Florida. As you are well aware, case mix index is an indicator that measures the severity of illness of those patients admitted to our hospital and compares this with other facilities.

We are pleased that our mortality rates for all causes and for each of the eight diagnostic conditions are within the predicted ranges. This is extremely important as our case mix index is very high.

If you have any additional questions, please do not hesitate to contact me.

Sincerely,

Don S. Steigman
Executive Director

ATTN: Robert Moore

Dear Gail:

The quality of medical care delivered at Bayfront Medical Center is our highest priority. Patient care is constantly reviewed by internal and external organizations.

At Bayfront, quality assurance subcommittees comprised of physicians in every medical specialty meet monthly to review mortality, readmissions, complications and selected diseases or procedures. JCAHO, PRO and HRS are among the external review organizations who evaluate our quality of care.

We are convinced that Bayfront Medical Center provides excellent care and this has been confirmed by our review organizations. In 1991, JCAHO accredited our hospital with an overall score of 93 out of a possible 100.

HCFA mortality data is not a valid measure of quality of care. Published research data do not support use of HCFA's mortality model as a quality of care measure. For example, a major factor that HCFA uses in evaluating the hospital's mortality rate is whether or not the patient was admitted from a nursing home. In HCFA's 1989 data, .3% of Bayfront's sample were listed as admitted from skilled nursing facilities, much lower than we know to be the case. After conducting a focused chart review of HCFA sample admissions, however, we can document at least 8% of our Medicare admissions, not .3%, came from skilled nursing homes.

HCFA's 1990 sample reports .2% skilled nursing home admissions or transfers. Based on the 1989 findings, we know this is significantly underestimated. This is important because HCFA expects a higher mortality from nursing home admissions and, thus, the difference between our observed and expected mortality would be decreased.

Many of our patients admitted from nursing homes had DNR (Do Not Resuscitate) orders. These patients instruct the hospital not to prolong their life with heroic medical measures. Therefore, patients with DNR orders should be excluded from the HCFA sample.

The HCFA data also does not consider Bayfront's role as a Level II Trauma Center. Bayfront offers the community an important service by providing Level II Trauma Center care with our medical emergency helicopter to a seven-county area.

Bayfront has an important mission of social responsibility. We provide 46% of all charity care in Pinellas County. HCFA designates Bayfront as a Disproportionate Share hospital, meaning our Medicare patients exceed a certain threshold of patients receiving federal income assistance as well as an excess of Medicaid patient days. Patients who are classified as indigent typically are sicker by the time they gain access to the health care system. The effect of poverty is not reflected in the HCFA rate.

The HCFA mortality rate is constructed from billing information (a UB-82 form) rather than medical record information. Making clinical judgments about the likelihood of mortality and the quality of care delivered is an inappropriate use of billing information.

Bayfront's mission of social responsibility and our commitment to trauma services are not taken into consideration by the HCFA data and, in fact, HCFA's use of the billing information penalizes us for providing these essential services to the community.

Very truly yours,

James W. Albright
President

Re: Medicare Hospital Information - 1992

Dear Ms. Wilensky,

We have reviewed the FY 1990/89/88 Medicare Hospital Mortality Rates for Broward General in great detail.

Whenever medical care at Broward General is discussed, it is important to provide a proper perspective in which to evaluate the care at our medical center. Our Emergency Department is the second largest in Florida. Patients received here are generally in a higher risk category and are more seriously ill. To substantiate this statement, Broward General's Medicare Hospital case Mix Index, an indicator of our patients' severity of illness, has increased 20.2% since 1988 and is now at 1.64.

In addition, Broward General services many patients of lower socio-econimic strata. Again, to substantiate this statement, Broward General is a Disproportionate Share hospital. A designation made by the Health Care Financing Administration of those hospitals whose patient populations exceed a certain threshold of receiving Federal Supplementary Security Income.

Broward General, being conveniently located to several local area nursing home facilities, has a considerable number of patients directly admitted from these facilities. Many of these patients, as specific medical record review has indicated, are of advanced age, and admitted with multiple concurrent and/or chronic illnesses. Moreover, many patients are placed, as our detailed medical record review revealed, in a "Do Not Resuscitate" status by the patient's own desires or by those of the family. With the New Patient Self Determination Act becoming fully implemented many more patients will request an Advance Directive to allow them to die. This is a fact and should be considered in any analysis of deaths. Furthermore, it should be noted that Broward General has an active 8 Bed Hospice Unit.

Again this year the presentation of the mortality data extends the reporting of the mortality rates at 30, 90 and 180 days from admission. Our analysis revealed the fact that a considerable number of deaths attributed to Broward General did not occur at the hospital. Therefore, it is difficult to arrive at any conclusions relative to the relationship between hospital care and actual mortality rates when Broward General had no control or involvement with the patient.

Moreover, it should be noted that in some instances, patients are double counted as when they appear in one of the eight medical categories defined by the principle diagnosis, and in one or more of the nine categories defined as a surgical procedure.

The Health Care Financing Administration has again presented the FY 1990 Medicare Hospital Mortality Rates in a manner in which an understanding of statistical analysis is necessary to interpret the results. Although statistically significant data is useful for identifying possible areas for further investigation, the general public may require further clarification and interpretation regarding the data presentation. For example, the precision and interpretability of the data are questionable when no standard deviation is calculated (generally in categories with no deaths or 50 or fewer cases).

Our review of the overall data, revealed that Broward General's observed mortality rates, utilizing prediction intervals small enough to identify areas of further review if needed, indicated that Broward General's observed mortality rates were statistically comparable with national norms. However, we would like to comment on the observed mortality rate of one surgical procedure category - Initial Pacemaker Insertion. It should be noted that no standard deviation, a measure of uncertainty, could be calculated because the number of cases was too low; therefore, the precision and interpretability of the observed versus predictated mortality rate for this procedure is questionable.

Our analysis, however, showed that one mortality attributed to us under the Initial Pacemaker Insertion category did not have the procedure performed on the admission in which the patient expired. The detailed medical record review of the mortalities, where an Initial Pacemaker was inserted at Broward General (another case did not expire in Broward General), revealed that the patients all had medical conditions which met the indications for permanent pacemaker insertion. Upon review of the records, there were no complications resulting from the surgical procedure. All patient expirations were related to other, multi-system complications present at the time of death.

Broward General is fully committed to the philosophy that the most effective manner in which to assure and improve the quality of care is to devote our efforts to our own systematic and ongoing assessment and continuous quality improvement. We perform 100% mortality review through a monitoring and evaluation process involving all hospital medical Staff quality assurance committee members.

Sincerely,

Wil Trower, Administrator

Baltimore, Maryland 21207-5187
ATTN: Robert Moore

Dear Mr. Moore:

Cedars Medical Center, a not-for-profit tertiary care hospital licensed for 585 beds and staffed for 432 beds, agrees with HCFA's written statements regarding the limitations of the mortality data and the recommendation that the data not be used by itself to make judgments about the quality of care in an individual hospital.

As a JCAHO accredited hospital, the medical staff at Cedars Medical Center conducts monthly reviews of individual patient medical records for all diseases and operations to evaluate the quality of medical care and to improve the patient and family's satisfaction with the overall delivery of hospital services. This individual case review rather than just a statistical review is required to adequately address the many factors such as multiple diseases and the socioeconomic environment that affect the treatment and outcome of any one patient's hospital experience. Furthermore, we believe that quality of care reviews should be performed for all patients and not just patients whose outcome was death in order to continuously improve the quality of patient care.

A Corporate Member of Cedars Health Care System
1400 N.W. 12 Avenue • Miami, Florida 33136 • (305) 325-5511

Analysis of HCFA Data

1. The data does not meet the HCFA criteria of deaths occurring at 30, 90, and 180 days post admission. Of the 459 deaths, 71 occurred after day 180; therefore, the observed mortality rates in several categories are incorrect.

2. Two hundred and thirty-seven (237) of the 459 deaths occurred outside the hospital; therefore, the cause of death is not known to the hospital. Placing these patients in the category related to the hospital admission is questionable.

3. A large percent of the "elderly" population resides in the Miami area. At Cedars Medical Center, 31% of the total deaths occurred in patients 85 years of age and older and 67% of the total deaths occurred in patients over the age of 74.

Cedars Medical Center supports nationwide efforts to develop indicators that truly measure the quality of care. HCFA is encouraged to support industry efforts to not only measure but to improve the quality and accessibility of healthcare services beyond the hospital setting. Services such as home health, nursing home, and hospice care provide a continuum of care that builds on the treatment provided in the hospital setting. The availability of these services directly affects the patient's health status.

Sincerely,

Thomas G. Culbreth, President
and Chief Executive Officer

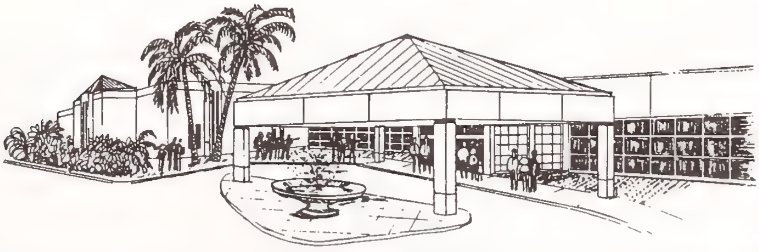
ATTN: Robert Moore

Dear Mr. Moore:

Thank you for the opportunity to respond to the latest HCFA mortality data from 1990. We have closely and thoroughly reviewed the mortality rates for the diagnostic categories provided, as well as, the detailed patient information for these discharges.

As you may be aware, Deering Hospital (formally Coral Reef Hospital) changed ownership September 26, 1990 and during the past year, we have assessed and revised, as appropriate, all of the quality assurance programs that were in place at the time of the purchase. The hospital received a 3-year accreditation by the Joint Commission on Accreditation of Healthcare Organizations in February, 1991. In addition to new ownership and management of the hospital, there are several key observations I'd like to present regarding HCFA's 1990 mortality data with respect to Deering Hospital:

- Close review of the records indicates that the average age of patients who expired was 81 years old - older patients are at obvious risk for reduced longevity.
- 40% of all patient expirations that occurred at the hospital were transfers from nursing homes, a patient group typically at the later stage of life.
- Our physicians will appropriately admit based on medical necessity and care for patients in the hospital whether or not they are likely to obtain long-term survival rates.



9333 S.W. 152nd Street ▲ Miami, Florida 33157-1780 ▲ (305) 251-2500

- With the longer periods of mortality reporting from thirty days post-admission, to 90 and 180 day periods, only 40% of the deaths reported in the report actually occurred at the hospital (the prior year's report was 46%). It is difficult for the hospital to ensure longevity for older patients discharged to nursing homes.

- Due to the readmissions of a number of our patients, the inclusion of only 1 admission per patient rather than including all admissions may tend to distort our mortality results versus the HCFA predicted ranges.

- A mortality rate is a crude indicator of quality since many variables come to bear upon a patient's chance to survive in a hospital and post-hospital setting, including, but not limited to, age, secondary diseases, nutrition, lifestyle, nutritional status and post-hospital care.

Most hospitals and physicians are well informed consumers of healthcare and know that mortality statistics should not be used as a performance indicator, nor as a guide to gauge the quality of care. We are confident that our established ongoing quality assurance program is effective in ensuring that Deering Hospital will continue to provide quality care to our patients. We will also maintain our commitment to compassionate care for older people whether or not they have the potential for long-term survival.

Since the hospital changed ownership and our name subsequent to the mortality results for 1990, **I BELIEVE THAT THE RESULTS SHOULD BE PUBLISHED UNDER THE NAME OF CORAL REEF HOSPITAL.**

Thank you for the opportunity to present these comments in advance of their publication.

Sincerely,

Jamie E. Hopping
Chief Executive Officer

Medicare Provider #100210

Florida Medical Center
5000 West Oakland Park Boulevard
Ft. Lauderdale, Florida 33313 (305) 735-6000

Florida Medical Center is a 459-bed, acute care facility, which served 8,229 Medicare admissions during 1990, whose average length of stay was 7.93 days. The Hospital serves as a referral center for Cardiac Catheterization (3,116 in 1990), Percutaneous Transluminary Cardiac Angioplasty (605 in 1990), and Open Heart Surgery (535 in 1990). The first Open Heart Surgery in Broward County was performed at Florida Medical Center, in 1975. Patients are referred for coronary artery bypass graft (CABG) surgery from eight surrounding hospitals. The majority of our open heart patients in 1990 were above 70 years of age. Because of the large number of very elderly Medicare patients in this retirement community, the incidence of stroke, chronic obstructive pulmonary disease, hip replacement/reconstruction, and cardiac disease is substantially higher than that experienced in other areas of the country. Since the average age of Florida Medical Center Medicare patients is 77.2, any evaluation of Florida Medical Center mortality rates must include a realization that the majority of our patients exhibit more than one serious disease process.

In reviewing our hospital's data, we suggest any future report consider the following: The HCFA Mortality Data for mortalities occurring after discharge from the hospital does not consider the cause, circumstances or condition at the time of death and therefore should not be attributed to the originating hospital. We question the HCFA designation of hospital accountability for a mortality of transferred patients.

It was noted that a patient discharged from this facility to another acute care facility and who expired at the other acute care facility at a later date was included in our hospital's mortality rate. We question whether a mortality occurring at another hospital should be charged to the originating facility.

An analysis of the hip replacement/reconstruction data indicated that a patient well enough to be discharged after the hip procedure was included in our mortality statistics for hip replacement even though the patient expired one month later from a completely different condition, namely, cardiac arrest.

Therefore, we question the assignment of a mortality to a Procedure completely different from the medical condition which caused the mortality. We suggest that, in discussing the HCFA mortality data, it be emphasized that a subsequent mortality may not be at all related to the condition or procedure to which a mortality rate has been assigned.

Florida Medical Center
5000 West Oakland Park Boulevard
Ft. Lauderdale, Florida 33313 (305) 735-6000

Medicare Provider #100210
Comments/Page Two

The HCFA mortality rates for surgical procedures, especially coronary artery bypass graft, do not indicate whether or not surgery was elective or emergent in nature. It appears that the HCFA mortality data for CABG, in some instances, also included valve replacement, which would increase the mortality rate.

It is our impression that the HCFA mortality rate for patients with the condition of sepsis is higher than the predicted rate because the majority of patients were also suffering from other severe conditions, such as chronic renal failure, diabetes, etc.

As in 1988 and 1989, the 1990 HCFA observed mortality rates for all causes for Florida Medical Center Medicare patients fell below the predicted rates.

RE: FY 1990 MEDICARE HOSPITAL MORTALITY RATES

Dear Ms. Wilensky:

Thank you for the opportunity to add commentary to the statistical conclusions made by your organization.

SEVEN MEDICAL CONDITIONS STUDIED

The seven medical conditions studied for FY 1990 accounted for a small number of the deaths which occurred within 180 days after admission to Gadsden Memorial Hospital. The reader might conclude that since HCFA picks the conditions for study, and because the number of patients seen at our facility of those conditions studied are not significant enough in number to allow for the drawing of standard deviations, then the most pressing medical concerns of HCFA have been met at Gadsden Memorial Hospital. This however would be an unstudied conclusion: simple statistics are not ample data from which to conclude the quality of care.

Of the 78 reported deaths represented in the conditions category, we concluded the following:

18 of the 78 deaths occurred during the original hospitalization.

21 of the 78 deaths occurred during a subsequent admission, falling within the 180 day period of the initial admission. Of these 21 deaths, 18 patients died with a different diagnosis than that they were originally admitted with, earlier in the 180 day period.

39 of the 78 deaths occurred after the patient was discharged from the hospital.

GADSDEN MEMORIAL HOSPITAL
U.S. 90 EAST • P.O. BOX 819 • QUINCY, FLORIDA 32351 • (904) 875-1100

DEATHS FROM ALL CAUSES

The number of deaths from all causes accounted for the bulk of the cases reported. A single figure, indicating standard deviations from predicted death rates, can not in our opinion, be used as a standard upon which to judge quality of care. Other tools presently exist to assure and measure quality, not only to Medicare Patients, but to other classes of patients as well. Medical institutions, such as ours, utilize current evolving processes such as quality assurance, utilization review and peer review, and in-house-mortality review to achieve these ends. In conclusion, we believe that **the use of mortality statistics, although usefull in a limited, very basic application, is not an indicator of the quality of care delivered in an institution.**

Sincerely,

Barbara Landy

Dear Mr. Moore:

Palms West Hospital has received the annual release of Medicare Hospital information, and has completed an initial review of the data.

Initial review findings indicate a significant increase of 29 percent Medicare admissions from 1989 - 1990. Conversely, we also noted that the small number of deaths and/or cases relevant to specific categories were too small for statistical relevance.

These comments are offered for your consideration.

Sincerely,

Re: Medicare Provider No. 100225

Dear Dr. Wilensky:

Please accept Hollywood Medical Center's comments on the HCFA mortality statistics for the calendar year 1990.

Hollywood Medical Center is a general acute care hospital located in Hollywood, Florida which generally serves an elderly patient population. The hospital does not offer obstetrics or pediatric services.

In review of the data provided for our facility, the mortality rates are noted to be within or below the expected ranges in all cases. There were, however, some instances where the number of cases was too small for satisfactory estimation.

Sincerely,

Holly Lerner

Attn: Robert Moore

Provider Number 10-0200

Dear Mr. Moore:

Imperial Point Medical Center appreciates the opportunity to comment on the Medicare mortality information. The Medicare analysis of hospital mortality rates provides hospitals with another means to evaluate the many components included in a Continuous Quality Improvement program. Although it is understood that mortality is a relatively insensitive measure of hospital quality and not a simple index of performance, Imperial Point Medical Center does review all mortality cases. The cases are reviewed for appropriateness of care and the results communicated to the Medical Staff, Administration and the hospital's Board of Directors. As in all Quality Assurance studies, actions are taken whenever problem cases are identified.

The mortality data provided depicts many categories with too few cases to permit satisfactory estimation of the standard deviation or provide any meaningful statistical analysis. The data depicts not only hospital deaths but also deaths occurring 30, 90 or 180 days after hospitalization. For those deaths occurring outside the hospital, it should be noted that other factors may have contributed to an individual's death and may not be within the hospital's control. Problems exist with limited availability and adequacy of post-hospital care.

When patients develop acute episodes of illness, they enter a hospital. Many variables come into play as to the outcome, such as, age, socioeconomic status, the patient's ability to access and willingness to seek health care, and compliance with following medical advice. Comorbidities such as cancer, cardiovascular complications and other terminal conditions will affect outcome. Finally, death can be incumbent on the patients' or families' wishes. Hospitals in the United States have many ways to prolong life. However, the final decision to provide life prolonging care may rest with the patient/family.

We support the Health Care Financing Administration's efforts to increase public awareness of the quality of health care. This effort is shared by Imperial Point Medical Center's commitment to providing quality care to the community it serves.

Sincerely,

Larry P. Anson,
Assistant Administrator - Finance

ATTN: Robert Moore

Dear Mr. Moore:

We appreciate the opportunity to respond to the statistics that the Health Care Financing Administration (HCFA) has compiled from Medicare Billing records. Our Medicare patients are important to us and we welcome the opportunity to discuss their care.

Kissimmee Memorial Hospital is a modern, acute care, private, for-profit hospital and a community resource. We take great pride in providing the quality of care the community expects from a full-service hospital. We feel as though the members of our community support the hospital and are confident of the quality of care we deliver. More area residents are turning each year, with confidence, to Kissimmee Memorial Hospital to fulfill their medical and physical needs.

Kissimmee Memorial Hospital's commitment to quality is tangible. In 1979, our parent company, Basic American Medical, Inc., invested approximately $5.3 Million to build a new community hospital. Additionally, we have worked with the Board of Trustees, the medical staff, the nursing staff and administrative personnel to continue to improve the quality of care.

Kissimmee Memorial Hospital now offers twenty-four hour coverage of the emergency room with physicians specially trained in emergency medicine, around the clock support services, technologically advanced cardiology lab, diagnostic ultrasound lab, echo-cardiography, nuclear medicine, CT scan, radiology, physical therapy, respiratory therapy, intensive care/cardiac care unit and complete medical laboratory. KMH is also full accredited by the Joint Commission on Accreditation of Healthcare Organizations.

Many new services have been introduced. Our special procedures room is an example of the expanding services and capabilities of Kissimmee Memorial Hospital. The angiography suite utilizes conventional radiology, fluoroscopy, computers, video technology and robotics to perform studies of the vascular system.

Kissimmee Memorial Hospital continues to provide the highest quality health care using new medical technology. In 1990 the Hospital acquired a KTP laser and is the only hospital in Osceola County which has this advanced piece of surgical equipment. The laser is used in surgery to cut tissue, stop bleeding and remove growths and tumors. It is only used by doctors who are specially trained in laser surgery.

Another new addition is the Spect Camera-Spectrum 1024DT. This system combines computers and a Gamma Camera to give radiologists a 360° view of various organs.

200 Hilda Street
Kissimmee, FL 34741-2302
(407) 846-4343

This allows the location of defects or abnormalities to be more precisely determined. This unit is also capable of dividing each heartbeat into several segments and providing the doctors with an extremely accurate measure of the heart's efficiency as a pump, as well as localizing damaged areas of heart muscle.

Kissimmee Memorial's new Olympus Video Endoscopy System is the newest innovation in Video Endoscopy and allows the doctor to diagnose and treat throat, stomach and intestinal problems more quickly and accurately. Known for its high-resolution images, it is the only technologically advanced system of its kind in the area. These and other additions are examples of how Kissimmee Memorial Hospital is enhancing the quality of care offered to our patients.

In our most recent efforts to increase the level of service to the citizens of Osceola and South Orange Counties, we began an extensive amount of refurbishing of the twelve-year-old hospital. The medical floor and front lobby were refurbished. All patient rooms were redone and a new nursing station was built. These renovations will continue throughout 1992 with the surgical and progressive care unit floors scheduled for remodeling.

Additional plans for 1992 include the addition of outpatient cardiac cath lab services. Cardiac catheterization is an invasive procedure which is used for diagnosis and management of patients with heart disease. Kissimmee Memorial Hospital perceived a need for cardiac cath services, as patients needing cardiac cath procedures are currently being referred to facilities outside of the Hospital's service area. The new cath lab will help assure that patients are receiving the best standard of health care available.

The medical staff of Kissimmee Memorial Hospital is involved in the review of the medical records of every patient discharged at this facility regarding medical management and overall care. HCFA's data has been carefully reviewed by the Utilization Review Committee, composed of members o the medical and hospital staffs, the Quality Assurance Committee, the Director of Medical Records and Administration.

We have evaluated and validated the statistics HCFA has given us. We agree that we are within HCFA's calculations for our predicted range. Of the Medicare patients who made up the 15.6% overall observed mortality rate, the average age at admission was 74.5 year. We care for and serve a 50% Medicare population.

The Medical Staff and Administration of Kissimmee Memorial Hospital will continue to review all cases for quality and appropriateness of care rendered to the individual patient as in the past.

Cordially,

James A. Summersett, III
President

ATTN: Robert Moore

Dear Dr. Wilensky:

Thank you for providing us the opportunity to review the Medicare hospital information for 1990 and for allowing our hospital the opportunity to comment on the data provided.

As one measure of quality in hospitals, mortality statistics must be continuously reviewed. We are pleased to note that the mortality data you have provided parallel the findings of our hospital's continuous quality improvement program. Specifically, the mortality statistics for all eight medical categories and nine surgical procedures are within the expected ranges defined as two times the standard deviation above and below the predicted mortality rates for each category.

When analyzing the "All Causes" category at 90 and 180 days, the observed rates reside slightly above two times the standard deviations for the predicted mortality rates. Upon further analysis of these categories, we note that 60% of the "All Causes" cases fall outside the categories and procedures included above. These cases are comprised of many small medical and surgical categories with less than fifty (50) discharges per category making statistical validity and interpretability impossible for these groups. Statistical randomness across these categories is believed to account for the majority of this difference. Another cause for this difference is the observed fact that many of the patients, whose average age at admission was 73.2 years, actually die 90 to 180 days post discharge of numerous causes which were unrelated to their original reasons for hospital admission.

Medicare Provider #: 100157

Our organization values information which helps focus our attention on areas where we can continuously improve our services to our patients. To this end we will use the Medicare mortality data in our comprehensive quality review program to seek opportunities for improving patient care.

When results of these reviews indicate significant clinical concerns, appropriate actions are taken which may include education or privilege modification. We continue to appreciate the efforts of the Healthcare Financing Administration in bringing this valuable information to our attention.

Sincerely,

Jack Stephens

ATTN: Robert Moore

Dear Dr. Wilensky:

Memorial Hospital would like to take this opportunity to provide comments on the Fiscal Year 1990 Medicare Hospital Mortality Rates released by HCFA on February 28, 1992.

For the past three years, we at Memorial Hospital have been analyzing our hospital-specific rates and continue to find problems with the accuracy of the data and the methodology employed by the Health Care Financing Administration in generating these reports.

Analyses of these and previous reports have demonstrated to us inconsistencies in the actual data for identical collection periods. A specific example of this inconsistency is in the total number of cases Medicare patients analyzed for your report released to us in 1991. The number of patients analyzed for all causes of deaths for 1989 was 4,113. However, in the current year's release for the same fiscal year, you list 4,135 patients. This reduced our observed mortality from 10.8% to 10.3%.

While it is understandable that new cases may have been added to this sample, it is unclear to us, however, how there can be a reduction of cases in specific disease categories. For example, in your 1991 release for fiscal year 1989, the number of cases of acute myocardial infarction analyzed by you for this institution was 226. In your current release, only 221 cases were analyzed for this same fiscal year.

3501 Johnson Street, Hollywood, Florida 33021, 305/987-2000

This reduced our observed mortality in this category from 31.4% to 28.5%, while increasing our predicted mortality from 26.3% to 26.9%. These changes in both the observed and predicted mortality reduced the clinical significance of the mortality data for acute myocardial infarction at our institution.

Changing the data base from year to year can lead to frustration for the Hospital. Faced with the information released in 1991 on mortality from acute myocardial infarction rate, we spent much time analyzing our own experience only to find this year that our rate was not as high as initially reported in your last data release.

Changes in the data released, as outlined above, can lead to a loss in credibility for the entire HCFA mortality study. Hospitals which seriously attempt to analyze these releases can find that the data from previous releases change from year to year impacting the clinical significance of the findings. HCFA should make it clear upon releasing the data that these numbers may only be preliminary because refinements in future releases may lead to significant changes in previously released data.

Memorial Hospital is also concerned with the publication of mortality rates at 90 and 180 days. We have in the past, and continue to believe, that the inpatient services delivered in an acute care hospital, particularly in one with a high volume of indigent and tertiary care, have less influence on late mortality rates than the socioeconomic conditions of the patients and their access to primary care following discharge. Neither one of these factors is considered in your data analysis and therefore may lead to inappropriate interpretation of the causes of mortality at 90 and 180 days post discharge.

The quality of patient care is the primary concern of Memorial Hospital. Continual efforts are undertaken to measure and examine that quality in terms of patient outcomes, processes of care, and patient satisfaction. While your data regarding mortality at Memorial Hospital could be useful in this process, our concern with the accuracy and consistency of this data limits its usefulness to us in the overall assessment of the quality of patient care.

Sincerely,

Frank V. Sacco
Administrator

Medicare Hospital Mortality Information

March 18, 1992

RE: Hospital Response

ATTN: Health Care Financing Administration

It is with pleasure that we of Naples Community Hospital note that all of our mortality statistics are within 1.5 Standard deviations of the normative values determined for the United States.

However, the fiscal year 1990 Medicare Hospital Mortality Rates have once again afforded us an opportunity to identify possibilities for improvement of patient care, as the deviation for open reduction of hip fractures remains greater than for other procedure causes in our institution.

Upon review of the fiscal year 1989 report we identified an opportunity for improvement in patient selection for carotid endarterectomy. Appropriateness criteria for patient referral have been developed and implemented. Any effect of this modification will probably not be evident until fiscal year 1992.

The fiscal year 1990 information for Open Reduction of Hip Fracture suggests the possibility of an opportunity for improvement of care in that area; however the information may be misleading because of inclusion in the Hip Replacement/Reconstruction category of both elective and post-traumatic cases.

We would like to suggest, because of the differences in the population and risk factors, that the mortality information on Hip Replacement/Reconstruction would be more helpful if subdivided into elective and post-traumatic categories.

There are two observations in regard to demographics:

We are reported to have 13 Medical Residents/Interns, when in fact we have none. Internal query indicates the possibility that State License records are in need of update or correction.

We are also reported to have no transfers from Skilled Nursing Facilities, when in fact there were 53 for fiscal year 1990. This discrepancy may indicate a need for an internal review of our use of available codes for reporting transfers. We may also require clarification from Medicare on this issue.

The Mortality Information remains a useful source of information for identifying opportunities to improve care.

Sincerely,

William Crone
President, Naples Community Hospital

MEDICARE MORTALITY DATA COMMENTS

The hospital mortality data, recently developed and released by HCFA, represents an improved system for calculating and reporting hospital mortality data over prior years. Of particular benefit is the reporting of deaths 30, 90 and 180 days post admission to the hospital for the year 1990. This information may provide additional insight to hospital medical staffs in their continual review of all deaths.

However, there continues to be flaws in the data collection and reporting system that may easily lead to misinterpretation. In-depth analysis of mortality data developed by HCFA for Palms of Pasadena Hospital, indicates that the data may be useful when deaths are reported by diagnosis as opposed to procedure and when the sample size is adequate enough to establish a standard deviation (50 cases or more). However, when the sample size is below 50 cases, which prevents the development of a standard deviation, valid conclusions cannot be reached. Mortality data regarding procedures may be misinterpreted since frequently death is unrelated to the procedure.

It must be emphasized to those who attempt to interpret the data that there may or may not be a relationship between the admitting diagnosis or principle procedure and the cause of death. For example, HCFA reported that Palms of Pasadena Hospital had 15 deaths that were attributed to the prostectomy surgical category. However, review of the medical records of these patients indicates that death was unrelated to the prostectomy surgery. In several cases, death occurred over seven months after the prostectomy surgery. The above points out that often times, particularly in regards to mortality data associated with the principle procedures, there may be no relationship between the cause of death and the procedure performed.

Also of concern to hospitals is the methodology utilized by HCFA to calculate mortality rates. Unfortunately, it is difficult for hospitals to recalculate their statistics for comparison purposes because of the complex methodology used by HCFA. It would be more beneficial to hospitals and others who use mortality data if HCFA would use the same methodology that hospitals have traditionally used to calculate mortality rates.

In closing, Palms of Pasadena Hospital and its medical staff welcomes the improvements made by HCFA in its reporting of mortality data and will utilize the data as an adjunct to the Quality Assurance program of the hospital. We look forward to further improvement of the data measurement system in the future.

Doc. 0384/0006m

PAN AMERICAN HOSPITAL

Hospital ID: 100076

Pan American Hospital supports efforts towards the establishment of utilizing quality indicators when reporting mortality statistics. Only through meaningful information can consumers make intelligent healthcare decisions. However, as in previous years, we are still faced with the problem of being limited to measurements which are open to misinterpretation and confusion by the public.

It would be unreasonable for us to attempt to explain the meaning of the statistical data provided. This year's report does not provide an expected mortality "range". One would be able to calculate the expected range by using the standard deviation. As stated in the report from HCFA, the "number of our deaths are too small" to allow a standard deviations to be estimated, therefore, in our case the "predictors" are subject to chance. Inotherwords, one can not accurately estimate what would be an expected range for our facility.

In our commitment to monitoring the quality of care rendered to our patients, our Medical Staff participates in the reviews on all mortality cases. These reviews evaluate the quality of care provided, the appropriateness of treatment, and whether death was an expected and/or inevitable outcome. Overall, our case reviews showed care

ATTN: Robert Moore

Dear Mr. Moore:

We welcome the opportunity to comment on our 1990 Medical Hospital Mortality data. In the specific analysis of our hospital data, we calculated the overall observed death rate with the predicted death rate and determined that our rate is within the 95% confidence range of expected deaths. Of the seventeen categories of conditions and procedures listed, only two individual categories had sufficient numbers to permit evaluation. In both categories our actual rate was below the predicted mortality rate.

While we are supportive of all efforts to improve the measurement of health care outcomes in order to address improvements in the healthcare delivery system, we would like to point out that our confidence as a provider of care in our community originates in a successful internal quality assessment and improvement program.

As part of our Medical Staff Monitoring and Evaluation process, we conduct 100% Mortality Review at our facility. All deaths are carefully screened by knowledgeable professionals and receive appropriate peer review. Any problems are addressed and opportunities to improve care undertaken. Through this planned and systematic process, supported by our Governing Body, we are able to address the clinical aspects of care, which are not included in the published mortality data.

RE: F.Y. 1990 MEDICARE HOSPITAL MORTALITY RATES

Dear Sir:

We have reviewed the F.Y. 1990 Medicare Hospital Mortality Rates prepared by HCFA, with emphasis on those conditions and procedures in which our observed mortality rate exceeded the predicted mortality rate. We wish to point out that the number of cases in each category was less than 50, too small a number to provide an adequate sample size or statistically significant information. HCFA supports this premise by the fact that the standard deviation was not calculated on any category because "the number of deaths or cases is too small for satisfactory estimation".

As in previous years, we will utilize this information in our quality assessment and improvement program. Peer review of the medical records is the only way to determine if a quality issue exists.

Sincerely,

Gary L. Rowe

RESPONSE TO 1990 MORTALITY DATA

The following information should be considered when reviewing mortality data from South Seminole Community Hospital:

Condition:

Congestive Heart Failure

Average age at time of death: 75 years.

Chronic Obstructive Pulmonary Disease

There were four deaths out of 18 patients treated. All were former smokers with a history of lung disease/emphysema. Average age at time of death: 74 years. Three of the four had significant comorbidities including CHF, renal failure, and coronary atherosclerosis.

Transient Cerebral Ischemia

There was one death out of eight patients treated. This patient had numerous other medical problems including hypertension, diabetes, thrombocytopenia, and pacemaker inserted.

Stroke

Average age at time of death: 82 years.

Sepsis

Average age at time of death: 83 years.

Procedures:

Hip Replacement/Reconstruction

Four patients died more than 30 days after being discharged from South Seminole Community Hospital. All four patients had numerous medical problems. Two had metastatic cancer; two had congestive heart failure and cardiac arrhythmias. Average age at time of death: 76 years.

Prostatectomy

Four deaths out of 74 patients treated. Average age at time of death: 79 years. Three of the four patients died more than 30 days after discharge from South Seminole Community Hospital. Three patients had cancer of the prostate along with a significant comorbidity including one of the following: lung cancer, history of stroke, TIA.

Cholecystectomy

One death out of 13 patients treated. This patient was 80 years old and died more than 30 days after discharge from South Seminole Community Hospital.

Comments on Health Care Financing Administration Mortality Data

The response to Medicare Hospital Mortality Information for the above hospital will be divided into two categories: 1) Mortality Information and 2) Hospital Characteristics.

I. Mortality Data

St. Joseph's Hospital's mortality rates are within the Health Care Financing Administration (HCFA) predicted ranges in all areas reported. However, due to the potential for inaccurate conclusions, which may be drawn from the data, it is important to point out the flaws in the information scheduled for release.

First, mortality rates are not a measure of the quality of care patients receive. Selecting patient outcomes, such as deaths, is a method used by a hospital's Quality Assurance Department to identify cases which need further analysis. Without this review, the information is misleading and inaccurate.

Secondly, the mortality rates presented do not account for the severity of the patient's illness. Severity of illness is the most significant variable when predicting the chance of death.

Lastly, the mortality rates presented are neither valid nor reliable for the following reasons:

1) It is not known if the predicted death rates are "normal death rates." Hospital death rates are being compared with numbers that may be meaningless.

2) There may be errors in diagnostic categories. The diagnosis used as the cause of death may not be the reason the patient died. For instance, the information includes patients who died following discharge from the hospital, if they died within 30 days of admission. It is possible for a patient to be admitted for a heart problem, be discharged, and die as a result of an auto accident. This patient's death would be attributed to heart disease at the hospital. For those patients who died while hospitalized the same kind of error may occur. For example, a patient with cancer may be admitted with pneumonia, but die from the malignancy. This death would inaccurately be attributed to pneumonia.

3001 W. Dr. Martin Luther King Jr. Blvd. • P.O. Box 4227 • Tampa, Florida 33677-4227 • (813) 870-4000

With the aforementioned flaws in mind and the potential for misuse of the information, St. Joseph's Hospital feels the release of this information does not "offer insight into the results of patient care not previously available." It will not provide useful information to help consumers make more informed decisions about their health care.

II. Hospital Characteristics

Errors in Hospital Characteristics have been corrected as displayed below Registered Nurses 598, and Licensed Practical Nurses 149.

Attention: Robert Moore

Dear Mr. Moore:

We welcome HCFA's continuing effort to assess institutional quality of care, however, this mortality based method requires further refinement and validation before it can be considered useful.

The potential for misunderstanding and misuse of this data is too great and we caution against using the data as an index of quality.

We do support the concept of developing objective measures for assessing quality of care and we continue to evaluate methods within our hospital.

We welcome the opportunity to contribute to progress toward this goal.

Sincerely,

Larry Read

Re: MEDICARE HOSPITAL MORTALITY INFORMATION-PROVIDER #100040

Dear Dr. Wilensky:

St. Vincent's Medical Center (SVMC), Jacksonville, Florida has reviewed the Medicare Hospital Mortality Information provided by your office.

The report shows a total of 4266 Medicare patients discharged from SVMC during 1990. The number does not reflect that many patients were admitted multiple times over 1990, often for reasons unrelated to the previous discharge. Our records reflect 7500 Medicare patient discharges in 1990, 76% more than the report. There are some other discrepancies within the data provided related to percentages of patients with comorbidities as follows:

COMORBIDITIES	HCFA REPORT	ACTUAL
Cancer	6.9%	15.5%
Chronic CV Disease	50.8%	60.6%
Chronic Liver Disease	.8%	1.3%
Chronic Renal Disease	5.1%	8.1%
Chronic Pulmonary Disease	22.5%	24.4%
Diabetes Mellitus	8.1%	15.7%

These discrepancies are important because predicted mortality is impacted significantly by comorbidities.

The validity of the survey methodology is questionable. The random selection of one discharge for patients with multiple discharges, results in cases where the patients' death was totally unrelated to the discharge utilized in the analysis. In addition, by randomly selecting one discharge to attribute to a patient, the denominator utilized in assessing mortality rates can be skewed. For example, HCFA reports 45 patients with an observed mortality rate of 6.7%. There were in fact 69 patients with an observed mortality rate of 4.3%.

It is important to note that the HCFA data does not constitute patient care quality or lack thereof. This information simply represents a statistical analysis of patient deaths. Quality assurance activities at SVMC are comprehensive and ongoing. The medical records of all Medicare patients were reviewed as a part of this process and any indicated actions were taken. Any health care decision a patient makes should be discussed with their physician.

Thank you for the opportunity to respond.

Dear Mr. Moore:

I have reviewed the 1990 Medicare Mortality statistics that were forwarded to Tallahassee Community Hospital. The following comments are submitted based on the report:

- A concern is registered regarding the validity of comparing a principal diagnosis during a single admission (based on one of perhaps multiple hospital admissions) to the patient's actual cause of death, especially given that the patient died up to 180 days following discharge.
- I echo concerns expressed in past years that if in fact a category lacks sufficient numbers of patients (less than 50) to establish a standard deviation, why print the data at all.

Again, as an administrator, I find that by publishing your simplified data into diagnoses representing 1988, 1989, and 1990 rates, the wrong impression could be arrived at, by the public, that care is less than optimal in a given facility. Remarks that in inadequate sample of cases and/or details of mortality rates verses a death that occurred 30, 90, 180 days following discharge from an unrelated cause could be damaging to a facility.

I maintain that publishing a report which by your admission lacks an adequate representation, is highly questionable.

Sincerely,

Nick Carbone

Dear Dr. Wilensky:

Thank you for the opportunity to review the mortality statistics for Fiscal Year 1990. We appreciate your efforts to attempt to turn data into useful information for Medicare beneficiaries. Of specific note, Tallahassee Memorial is pleased to see the addition of some demographic and defining factors published along with the mortality data. Our role as a regional referral center creates a patient population which includes the regions most severely ill patients.

Tallahassee Memorial has spent considerable energies using severity of illness indexes to help us define and serve all our patients in the most efficient and effective manner. We hope to see some of these concepts used by HCFA in the near future. Our own efforts analyzing outcomes and severity of illness data have shown us that there are many complex issues which must be considered when using these data upon which to base assumptions about quality.

As we have previously stated, the mathematical models used in mortality prediction have various forms of error and can be misleading at times. HCFA's graphic representation of the past three years data for the "All Causes" category was calculated using measures of standard deviation. We have attached a table of ranges using HCFA's standard deviation measures for the 17 other categories listed. Comparing Tallahassee Memorial's actually mortality rates with the standard range of 1990's predicted rates indicates that the hospital is within the predicted range for each of the conditions and procedures. It should be further noted that Tallahassee Memorial does not have an appreciable number of deaths in many of the 17 diagnostic and procedural categories reported by HCFA. For the 1990 data, Tallahassee Memorial has so few cases in 8 of the categories that a standard deviation cannot be calculated due to the imprecision and interpretability of the estimates.

The healthcare industry is being besieged by all manner of data, data systems, data requirements, data specialists, etc; Tallahassee Memorial sincerely hopes that mortality prediction does not become the single measure of "quality" used by HCFA. There are multiple issues involved in making high quality, affordable healthcare available to people who need it.

RE: Mortality Data for Year 1990/Comments

The following comments are submitted to the Department of Health and Human Services/HCFA which are in reference to our facility's 1990 mortality data:

1. Hospital characteristics: The Hospital's licensed bed number is 140.

2. Occupancy rate: This rate is not accurate based on bed number listed above.

3. Staffing: The total number of physicians includes 178. These are classified as Active Staff, 70 and Courtesy/Consultant, 108.

4. Admission Sources/Types: The number of patients transferred from skilled nursing facilities is greater than 0.1%. This inaccuracy may be explained by an admission coding variance.

5. The Hospital's average age at admission is 78.6 years as defined by the fiscal year 1990 data. University General Hospital is located in a community predominantly consisting of a retirement-age population on the West coast of Florida. Many of the residents of the community reside in skilled nursing facilities, retirement living communities, and adult congregate living facilities.

6. When examining mortality statistics, specific attention should be given to the fact that the Hospital's number one co-morbidity is chronic cardiovascular disease. The Hospital's second highest co-morbidity is chronic pulmonary disease. At the time of admission, our Medicare patients have an increased severity of illness due to complex underlying medical conditions. The HCFA Mortality Data does not adequately consider the patients' severity of illness, including the complexity of pre-existing conditions and terminal illness. It should be noted that the Hospital's case mix index is 1.4, thus representing a relatively high case mix and DRG weight.

7. The Hospital's average length of stay is 8.3 days which is slightly less than the national average and equivalent to the State average.

8. The observed mortality rate was less than the predicted mortality rate in five (5) out of the seven (7) procedure classifications in the 30-day period for 1990. This is a substantial improvement shown in the statistical calculations over the two years prior.

9. In the calculation of observed mortality rates, in the "all causes" category, for the 30, 90, 180 day periods, these rates fall below a 95% prediction interval. These mortality rates for "all causes" are at upper statistical limits, but within predicted ranges for the "all causes" category. In the condition of congestive heart failure, the observed mortality rate is noted to be slightly above the predicted mortality rate for this specific condition; however, the standardized mortality ratio (SMR) and prediction interval directly correlates to rates calculated in the "all causes" category.

All of the above information should be taken into special consideration when evaluating the accuracy and the validity of the Hospital's Fiscal Year 1990 mortality data. It is the Hospital's opinion that the overall quality of medical care services is not directly related to mortality statistics. Should you have any questions pertaining to these submitted comments, please feel free to contact my office.

Sincerely,

Emil P. Miller
Administrator

Attn: Robert Moore

Dear Dr. Wilensky:

Thank you for giving West Boca Medical Center the opportunity to respond to its 1990 mortality data. The inclusion of the 1988 and 1989 information was useful as a ready reference for comparison. It is interesting to note that the data remains consistent even though the total number of cases increases each year.

Your agency's comprehensive explanation of the statistical method used to display the data was helpful. Publication of the national average length of stay as well as the state's figure to compare with West Boca Medical Center's average length of stay for Medicare patients in 1990 was valuable to us.

Again, thank you for sharing your information and for giving West Boca Medical Center an opportunity to contribute.

Sincerely,

Richard S. Freeman
